

01. The Problem

Solving the "Tracking Friction" in DSA Preparation

The journey to mastering DSA is often derailed not by difficulty, but by **administrative burnout**.

✖ The Manual Struggle

Students use Notion or Excel to track 400+ problems. Manually updating a checkbox after every solve is a tedious chore that leads to abandonment.

✖ The Integrity Gap

Manual trackers are based on trust. There is no verification that a problem was actually solved correctly on a platform like LeetCode.

✖ Consistency Decay

DSA requires daily habit formation. Without visual evidence of progress (streaks/heatmaps), motivation drops sharply after the first week.

✖ Fragmented Experience

Switching between curated lists (Striver/Babbar), the LeetCode IDE, and a tracker creates cognitive load and disrupts the "flow state."

02. The Solution: LeetPath

An Automated, Verified DSA Ecosystem

LeetPath is a sophisticated intelligence layer that sits on top of LeetCode, automating progress tracking and gamifying the learning process.

Core Value Proposition

We replace manual checkboxes with **API-driven synchronization**. When a user solves a problem on LeetCode, LeetPath detects it, updates the roadmap, and increments the streak—automatically.

Explore Live Platform →

Verified Progress

Direct sync with LeetCode accounts ensures that every "solved" mark is backed by actual code submission.

Curated Roadmaps

Integrated Striver + Love Babbar sheets (400+ problems), deduplicated and categorized by topic and company.

03. The "Magic" Workflow

Bridging Habit and Achievement

LeetPath doesn't just track; it **nudges** the user toward consistency using three core pillars:

1. The Sync Engine AUTOMATION

Connect LeetCode once. All solve dates and statuses are pulled via API, keeping the roadmap in perfect sync with the user's actual activity.

2. The Heatmap PSYCHOLOGY

A GitHub-style activity calendar that turns coding into a game. The "Streak Nudge" warns users before they break their habit, driving retention.

3. AI Mentor INTELLIGENCE

Integrated AI analyzer with **Voice Input**. Users can speak their doubts and get instant, context-aware guidance without leaving the app.

4. Instant Discovery UX

Powerful search filtering by Company, Topic, or Difficulty, allowing users to pivot their focus (e.g., "Amazon-only problems") in seconds.

04. Technical Architecture

Enterprise-Grade Implementation

Built with a modern, decoupled architecture designed for speed, security, and horizontal scalability.

Security Layer

Implemented **Helmet** for header security, **CORS** split-origin management, and **express-rate-limit** to protect against API abuse.

Data Strategy

Optimized JSON-based storage for problem datasets and user progress, ensuring sub-millisecond read times for the roadmap.

05. Scaling the Vision

From a Tracker to a Career Engine

LeetPath is the foundation for a wider ecosystem of developer success.

Hyper-Personalized Tracks

AI-generated roadmaps based on specific company goals (e.g., "The Google L3 Track") using real-time interview data.

B2B Institutional Licensing

Providing universities and bootcamps with a **Management Dashboard** to monitor student progress in real-time.

Predictive Gap Analysis

AI that analyzes a user's "Wrong Answers" on LeetCode to suggest specific theory videos or problems to fill the gap.

Social Coding Leagues

Private cohorts and leaderboards to foster community-driven competition and accountability.
